

Appl. No. 10/648,655
Amdt. dated May 23, 2005
Reply to Office action of February 28, 2005

REPLACEMENT ABSTRACT:

Please replace the Abstract on page 11 with the following new Abstract:

The disclosed device provides more versatility and creativity than is available with prior devices used for performing illusions. A translucent housing contains a light source (e.g., LED) and a power source (e.g., battery) in close proximity. A button at one end of the housing permits a user to activate the LED by applying pressure to the button. The pressure forces the battery into contact with a conductive element which then contacts electrical leads of the LED thereby activating the LED. When the pressure is removed, the LED turns off. The housing is removably attached to a user's fingers or thumb by means of a flexible band, strap or multiple flexible members.
